

Unique Detection for an Unique Building

The Sage Gateshead is a stunning and unique home for live music in the Northeast. The exciting and dramatic architecture was designed by Lord Foster's team, and consists of two performance spaces of acoustic excellence, Northern Rock Foundation Hall, a twenty five room Music Education Centre, The Barbour Room, a recording studio, 5 bars, a café and a brasserie.

Conventional fire detection devices would be problematical, for a building of such scale, with a ceiling height of some 40 Metres, so the solution for this unique building was to use Fire Fighting Enterprises' fire detection product - **FIRERAY**.

FIRERAY is a reflective beam smoke detector, capable of smoke detection up to a range of 100 Metres. Sixteen **FIRERAY** devices have been installed as part of the fire detection system. Their single end cabling, internal alignment aid, low level test unit, ability to cope with building shift, (The Sage Gateshead can move up to 50 mm), made them uniquely suitable as the number one choice for the Sage.

FIRERAY carries all the current world wide approvals, so is uniquely suitable for protecting large area buildings from The Sage Gateshead to Shopping Malls, from Churches to Hotel Atria, from Warehouses to Factories.
